I, Wanda Plimmer, am experienced in the design, development and manufacture of infant accessories and in particular breastfeeding accessories. It is my opinion that none of the references would make obvious my invention to a person having ordinary skill in the art. My invention makes breast feeding much easier for a mother while protecting the infant from harm by retaining the infant in a safe environment.

The front safety ridge of my invention was neither anticipated nor made obvious by the pillow means 32 of Dunn. I, respectively, do not agree that the front safety ridge and the pillow means 32 of Dunn are the same. In my invention, the infant is retained between the front safety ridge and the back wall. It is not taught that the infant is supported by the front safety ridge. If the infant were supported by the front safety ridge then according to Dunn the front safety ridge should be under the infant to support the infant. If the infant were on top of the front safety ridge, then the infant would not and could not be retained on the base by the front safety ridge. Rather the infant could easily roll off the front safety ridge and the base

and be harmed.

My invention teaches that the front safety ridge has "a curved transition from the top of the front safety ridge to the base toward the back wall". Neither Dunn alone, nor Dunn in combination with the cited references including Morton, Straub, Schwenker make this invention obvious to a person having ordinary skill in the art. In other combinations taught in my invention the front safety ridge may not have a curved transition.

My invention also includes "a breast shelf ... inclined downward toward the back wall for aligning the infant's mouth for breastfeeding". Dunn teaches away from my invention by teaching a planar base and upward curved walls extending away from the pillow 32. In contrast my invention has the "breast shelf inclined downward toward the back wall", which causes the infant's mouth to be tilted upward to facilitate breast feeding.

My invention has a first and second recess in the base adjacent to the first breast shelf and extending towards the back wall for accommodating the infant's shoulder and the arm when the infant's head is placed on either breast shelf. This is not taught nor made obvious by any of the references cited by the Examiner, and in particular Schwenker.

In summary, my invention is not anticipated nor made obvious in view of Dunn, Morton, Straub, Schwenker nor any of the other cited references.
